Last Updated: Aug 2021

RESEARCH INTERESTS

My research interests span Distributed System, Operating System, and Computer Architecture, with a focus on building fast and reliable systems for datacenters. I work at Wuklab, UCSD, under the supervision of Prof. Yiyang Zhang.

EDUCATION

University of California San Diego Ph.D. in Computer Science and Engineering	2019-2022 (expected)
Purdue University Ph.D. in Computer Engineering (Transferred to UCSD)	2016-2019
Institute of Computing Technology, Chinese Academy of Sciences Research Assistant	2014-2016
Beijing University of Aeronautics and Astronautics B.E. in Computer Engineering	2010-2014

INDUSTRY EXPERIENCE

Research Intern, Microsoft Research Collaborators: <i>Ziqiao Zhou, Weidong Cui, Andrew Baumann, and Marcus Peinado</i>	Redmond, WA, Summer 2021
Research Intern, VMware Research Collaborator: <i>Marcos K. Aguilera</i>	Palo Alto, CA, Summer 2019
Research Intern, VMware Research Collaborator: <i>Stanko Novakovic</i>	Palo Alto, CA, Summer 2018

PUBLICATIONS

Yizhou Shan, Will Lin, Arvind Krishnamurthy, Yiyang Zhang, “Disaggregating and Consolidating Network Functionalities with SuperNIC”, under submission.

Yizhou Shan*, Zhiyuan Guo* (co-first author), Xuhao Luo, Yutong Huang, Yiyang Zhang, “Clio: A Hardware-Software Co-Designed Disaggregated Memory System”, <https://arxiv.org/pdf/2108.03492.pdf>.

AWARDS

[2020 Facebook Fellowship Finalist](#)

SYSTOR'19 Best Paper Award

OSDI '18 Jay Lepreau Best Paper Award

OSDI '18 Student Travel Grant

SOSP '17 Student Travel Grant

SoCC '17 Student Travel Grant

PROFESSIONAL SERVICES

Program Committee

ASPLOS '21 (External)

OSDI '20 (Artifact Evaluation)

Journal Review

ACM Transactions on Storage (TOS): 2020

IEEE/ACM Transactions on Networking: 2020

RESEARCH EXPERIENCE

Network Design for Disaggregated Datacenter (Work-in-Progress) 2020-Current
UCSD

How to build a disaggregated datacenter when both the number of network ports and bandwidth requirement exploded? We propose a way to solve this issue without disrupting the existing network infrastructure.

Programmable Disaggregated Memory System (Under Submission) 2018-Current
Purdue University and UCSD

We are building a hardware-based active disaggregated memory system using FPGA. This is a follow-up work of LegoOS. We build a distributed hardware-based virtual memory system, and a framework for building memory services.

Serverless on Disaggregated Datacenter (WIP) 2019-Current
UCSD

We are trying to demonstrate when serverless means no server. Instead of using monolithic machines, we explore the possibility of using a disaggregated datacenter. Instead of optimizing existing VM and container technologies, we explore a new way to run serverless functions: using library OS.

An Operating System Inside Cloud FPGA (Concluded) 2019-2020
UCSD

We are building a new operating system inside a cloud FPGA. This new runtime overcomes the limitations of static compile-time approaches and provides a set of new services. We explored how this helps reduce cost and enable new FPGA apps.

Optimize Page Faults 2019 May-Aug
VMware Research

Ancient old page fault handling is the driving wheel for many emerging datacenter systems and applications. But the page fault handling mechanism was designed for millisecond-level disk operations, there is a performance mismatch when it is used by fast devices like RDMA, or PM. We are now trying to close the gap.

LegoOS: A Disaggregated Operating System

2017-2018

Purdue University

We propose a new OS model called the splitkernel to manage disaggregated systems. Splitkernel disseminates traditional OS functionalities into loosely-coupled monitors, each of which runs on and manages a hardware component. Using the splitkernel model, we built LegoOS, a new OS designed for hardware resource disaggregation.

Hotpot: Distributed Shared Persistent Memory

2016-2017

Purdue University

We propose Distributed Shared Persistent Memory (DSPM), a new framework for using persistent memories in datacenter environments. We designed and implemented *Hotpot*, the first DSPM system in the Linux kernel. Hotpot provides low-latency, transparent memory accesses, data persistence, data reliability and high availability.

Non-Volatile Memory (NVM) Emulator

2015-2016

Institute of Computing Technology, Chinese Academy of Sciences

We designed and implemented a NVM emulator in Linux kernel, which leverages Intel's Performance Monitoring Unit to emulate NVM's slower read/write latency and smaller bandwidth on physical DRAM. This emulator runs on bare-metal x86 machines.

ARMv8 CPU Project

2013

Institute of Computing Technology, Chinese Academy of Sciences

I participated in the Register-Transfer Level design and verification of some blocks within the cache unit and load-store unit. It is a commercial project collaborated with Huawei.

SKILLS

Languages: x86 Assembly, C, C++, Python, Scala, Rust, Go, TCL, Verilog, Java

Systems: Linux Kernel, DPDK/RDMA, KVM, QEMU, Docker, k8s, Pytorch, Tensorflow, Spark, Memcached, Vivado, Vivado HLS, Vitis, SpinalHDL, Chisel
